Trans. of Soinechnyye Dannyye (USSR) 1959, no. 9, p. 86-89.

A method for measuring the absorption of radio emission is described that is based on the method of recording the cosmic radio emission intensity at a fixed frequency, which should be higher than the critical frequency of the F₂ layer. The approximate relation of Warwick and Zirin (J. Atm. Terr. Phys. 11: 187, 1957) for the relative change in the mean electron concentration in the D layer was found to lead to significant error.

Trans. of Akademiya Nauk SSSR. Doklady, 1961,
v. 138 [no. 1] p. 125-126.

DESCRIPTORS: *Ferrocenes, *Magnetic susceptibility,
Paramagnetic resonance, Polymers.

The static magnetic susceptibility was measured for
magnetic field intensities of 3500 to 4500 oersteds and
temperatures from 20 to 120°. These polymers are
paramagnetic. The closer the ferrocene residues are
to each other in the molecule, the greater is the para-
magnetism. The values of the specific magnetic sus-
ceptibility of these polymers obtained in solutions were
the same as those in measurements on solid polymers.
